

Droplet #1 The asymmetric reflection of the water level and the tension of the droplet with peripheral droplets on the outer ring of this creates an offset balance

Droplet #3 Having a symmetrical balance from the bottom membrane and the top umbrella the droplets on the rim of the top membrane give a nice feeling of organization and balance

Droplet #2 Similar as to droplet #1, this instance still has this contrast between an off-kilter, smooth membrane of water however it is connected by a thicker, more sturdy trunk, clashing a gravitational tension, surface tension of water, and the movement frozen in time

Vortex #2 As well as being vertically symmetrical, it's just cool.
